MORBIDITY DATA FOR INDIVIDUAL STATIONS WITH STRENGTH OF 500 OR MORE	40

WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumas other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 3 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 1 SEPTEMBER 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATESAll Causes: Disease and Injury:

During the week ending 1 September 1944 the admission rate from all causes decreased to 520 per year per thousand strength, which is the lowest rate recorded for any week during this war. The current week's morbidity is 3 percent under the rate for the preceding week and 2 percent below the previous minimum rate for 1944 registered during the last week of June. The current week's admission rate is more than 20 percent under the lowest rate experienced for any week in 1943.

Morbidity from all diseases combined decreased slightly to 459 per thousand, which is about 35 percent lower than for the corresponding week of 1943.

The current week's admission rate from injury decreased sharply to 61 per thousand from 69 per thousand for the previous week. Current morbidity from this cause is the same as for the last two weeks of 1943 which were the lowest of any week during this war; the previous minimum rate for 1944 was registered for the week ending 5 May 1944 (64 per thousand).

Respiratory Causes:

Morbidity from colds, influenza, etc. increased from 67 per thousand to 71 per thousand for the current week, which is the highest rate reported since the week ending 23 June 1944. Nonetheless, the current admission rate is about 25 percent under the rate for the corresponding week of 1943.

The admission rate from pneumonia remained at 6 per thousand or about one-third lower than for the corresponding week of 1943. During the past ten

weeks morbidity from this cause has been at about the same level.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, decreased to 34 per thousand from the record high rate of 39 per thousand registered the previous week. Current morbidity from these causes continues at least 10 percent higher than during the corresponding period in 1943.

The admission rate from diarrhea and dysentery was reported at 11 per thousand, or approximately the same level as was reported for the previous month and considerably below the experience during the corresponding period of 1943.

The number of new cases of meningitis reported during the week decreased to a record low of 14 cases, or less than half the number for the corresponding week of 1943. The number of new cases of rheumatic fever remained at the low figure of about 60 cases per week, which is the minimum number reported for any week this year. During the current week the new cases of poliomyelitis numbered 12, which is the highest weekly total reported this year.

VARIATIONS IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate from disease decreased sharply in the First and Eighth Service Commands, while sizeable increases occurred in the Second Service Command and the Military District of Washington.

As a result, the Military District of Washington reported the highest morbidity from all causes (628 per

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

thousand) and from disease (585 per thousand); these rates would be lowered by about 10 per thousand if casuuals (not from this command) who were treated at Fort Myer were not counted in computing the rates. The lowest morbidity from all causes (447 per thousand) and from disease (385 per thousand) was reported by the Eighth Service Command, which for the last five weeks has registered the lowest admission rate from disease

Most of the Service Commands reported lower admission rates from injury, with only small increases being shown by the First and Third Service Commands. The largest decreases were registered in the Second, Seventh, and Eighth Service Commands, for all of which the change was 20 percent or more. The lower morbidity in these Service Commands resulted from decreases at a number of stations, the reduction not being concentrated at a relatively few reporting installations.

The Ninth Service Command with a rate of 70 per thousand reported the highest admission rate from injury, while the Second and Seventh Service Commands and the Military District of Washington, with rates of less than 50 per thousand, had the lowest rates.

Respiratory Causes:

The admission rate from colds, influenza, etc. increased in all Service Commands except the First and Eighth Service Commands, in which slight decreases were recorded. The greatest increases were registered in the Third, Fifth, Seventh, and Ninth Service Commands and the Military District of Washington.

The Second Service Command continued to report the highest morbidity from colds, influenza, etc. (97 per thousand). Only the Fourth and Eighth Service Commands reported rates of less than 70 per thousand, whereas several weeks ago the majority of the Service

Commands were in this category.

Morbidity from pneumonia showed little variation as between Service Commands, with only the Sixth Service Command having a rate notably in excess of the average for the country as a whole.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding EPTS) cases decreased in every Service Command. The greatest declines were registered in the Sixth, Eighth, and Ninth Service Commands. The Fifth Service Command, with a rate of 58 per thousand, reported by far the highest morbidity from these causes; morbidity of about 40 per thousand was reported by the First, Second, and Sixth Service Commands. All Service Commands except the Military District of Washington reported admission rates of 30 per thousand or more.

The highest morbidity from diarrhea and dysentery was reported by the Seventh Service Command, which had a rate of 23 per thousand for the current week as compared with 8 per thousand for the previous week; this sharp increase was caused entirely by an outbreak at Camp Crowder, which had an admission rate of 169 per thousand. Relatively high morbidity from this cause (of about 15 per thousand) was reported by the Fifth and Eighth Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate increased for the seventh consecutive week to 39.2 per thousand for the current week; this is the highest rate recorded since the week ending 3 March 1944. About 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 38.7 per thousand strength. The number of neuro-psychiatric cases remaining as of 1 September 1944 was reported at 15,852 or about 400 less than the previous week; out of the 15,852 cases 7,963 were in General Hospitals.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 1 September 1944 totaled about 30,700. The number of battle casualty patients remaining increased by about 1,200 to 13,246; all but 277 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 1 September 1944 the total number of enlisted men discharged by CDD was 3,470 about the same as the previous week and the highest number recorded since such data have been reported (in July and subsequent). About one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 1 September 1944 numbered about 287,000 or 2,000 less than at the end of the previous week. The total number of beds occupied was 138,000 (or 48 percent of the total beds authorized) which was about 1,000 more than at the end of the previous week. Included in the total authorized beds were 258 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 113,279 which was the same as the previous week. The total number of beds occupied in General Hospitals was 54,215 (or 48 percent of the authorized beds) which was about 1,300 more than at the end of

the previous week.

Station hospitals (as distinct from Regional Hospitals) reported about 107,000 total authorized beds, while Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 48,000 or 45 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 36,000 or 54 percent of total authorized beds. Eight stations (De Ridder AAB, La., Brookley Field, Ala., Stockton Ordnance Depot, Calif., Camp Clark, Mo., Florence PW Camp, Ariz., Camp Murphy, Fla., Camp Butner N.C. and Camp Callan, Calif.) reported more beds occupied than authorized beds; the first six of these were in this same category last week.

Included among the station hospitals are eleven which are designated as Convalescent Hospitals (ZI); three new hospitals were added to this group--Fort Story, Camp Butner, and Camp Carson. These hospitals reported 5,817 authorized hospital beds (3,325 occupied) and in addition 12,370 beds in convalescent facilities (1,854 occupied).

The bed capacity of convalescent facilities in General Hospitals was 21,421, an increase of about 2,000 beds, chiefly due to reporting of such facilities for the first time by Ashburn G.H. and to 900 additional beds at Hammond G.H. and 800 at Moore G.H. The total beds occupied in such convalescent facilities was 6,977 or 33 percent of the total bed capacity.

FORM SG-902-8 July 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

WOMEN'S ARMY CORPS

During the four week period ending 25 August 1944, the annual rate of admission from all causes among WAC personnel at 41 selected stations was 903 per year per thousand strength. This represents an increase of about 15 percent over the rate recorded for July. The August admission rate from all causes for the WAC is about 60 percent higher than for the total Army in the continental United States.

The 41 selected stations for which details are given in the following tables represent a larger coverage as compared with the previous months when only 32 selected stations reported their experience to the Office of The Surgeon General. In accordance with Section II, ASF Circular No. 215, 1944, 12 new stations were required to report beginning in August, while 3 of the stations formerly reporting were no longer required to do so, because their strength fell to a low figure. With the increased number of stations reporting, the proportion of total WAC strength in the country covered by the reports has increased to more than 40 percent.

As in previous months morbidity from all causes during August showed considerable variation by station. The admission rate for the majority of the stations ranged from 600 to 900 per thousand, but there were several stations with rates in excess of 1200 per thousand. The highest rates were reported from Arlington Hall Station, Wright Field, Ft. Bragg, and Ft. Riley all of which had rates in excess of 1700 per thousand. The latter two stations have reported high admission rates for the past four months.

The August admission rate from injury for the WAC was 72 per thousand representing about a 20 percent decrease from the corresponding rate for July. Morbidity from injury among the WAC during August was

at about the same level as for the total Army in the continental United States, although in previous months the WAC rate had been consistently higher.

For the first time since reporting began, the largest stations, Ft. Oglethorpe and Ft. Des Moines (which account for about 40 percent of the total strength of the 41 selected stations) experienced somewhat lower morbidity than the other stations; in June and July these stations reported about the same experience, while in previous months their morbidity had been on appreciably higher level.

Morbidity from colds, influenza, etc. among the WAC increased by about 10 percent during August to a rate of about 95 per thousand. This rate is almost 50 percent higher than that for the total Army in the continental United States but nevertheless may be considered as relatively favorable.

Morbidity from diarrhea and dysentery among the WAC was reported at 21 per thousand in contrast with a rate of about 12 per thousand for the total Army. The relatively high rate for the WAC largely reflected the unfavorable experience at Ft. Oglethorpe, which station accounted for over 70 percent of the total cases.

Neuropsychiatric disorders were in August responsible for an annual admission rate of 46 per thousand or about 20 percent higher than rates reported for WAC personnel in June and July but is considerably above the corresponding rate for the total Army in August. Morbidity from other communicable diseases shown in the following tables was at a relatively low level.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

WOMEN'S ARMY CORPS (CONT'D)

The number of CDD's during August averaged 23 per week or notably higher than the average of 15 per week in June and July.

As of 25 August there were 701 WAC patients remaining in hospital and quarters at the 41 selected stations. In addition to the 625 WAC's remaining in hospital at the selected stations there were 436 WAC's occupying beds in General Hospitals (exclusive of Walter Reed G.H. and Army and Navy G.H. which are among the selected stations). The number of WAC's occupying hospital beds at station hospitals exclusive of the 41 selected stations was 895. Thus the total number of WAC's occupying hospital beds as of the end of August was about 1950 or only very slightly higher than the corresponding figure for the end of July.

The number of WAC's occupying hospital beds in General Hospitals and all station hospitals combined as of the end of August represented a rate of about 28 per thousand strength of the WAC in the continental United States, or the same as for July. For the total Army in the United States the corresponding figure is 39 per thousand, but this is inflated by the inclusion among the patients of a relatively large number of evacuees from overseas. When adjustment is made for this factor, the revised rate for the total Army in the United States would be in the neighborhood of about 30 per thousand.

It should be noted that whereas the overall admission rate for WAC personnel is materially higher than that for the Army as a whole, the incidence of serious conditions as reflected by the proportion of WAC personnel in hospital is much the same as for other Army personnel.

FORM SG-728 - 1 May 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

PRISONERS OF WAR

During the four week period ending 25 August 1944 the admission rate from all causes among prisoners of war was 596 per year per thousand strength. This rate is about 10 percent higher than for U.S. troops in the continental United States during August. The admission rate from all diseases combined for prisoners of war was about 480 per thousand or only slightly higher than for U.S. troops, while the admission rate from injuries was about 120 per thousand or approximately 60 percent higher than for U.S. troops in this country. Morbidity from disease among prisoners of war during August was about 10 percent lower than during June and July, but morbidity from injuries remained at approximately the same level.

About 95 percent of the total strength of the prisoners of war in the U.S. (as reported by The Provost Marshal General) is included in the reports received in the Office of The Surgeon General. This is chiefly because no reports are submitted to the Office of The Surgeon General for prisoners of war in penal and medical institutions and for those enroute from ports of debarkation to prisoner of war camps. Other contributing factors are the failure of a few main camps to report all of their side camps and the non-reporting of a small proportion of the Italian Service Units.

Italian Service Units continued to experience morbidity somewhat higher than that of Italian prisoners but about the same as for German prisoners. The admission rate for disease of the Italian Service Units was almost double that for Italian prisoners.

Morbidity from injuries among German prisoners continued relatively high at 128 per thousand; for Italian Service Units the rate was only slightly lower

(104 per thousand), but for Italian prisoners the corresponding figure was only 40 per thousand.

Morbidity from colds, influenza, etc. among prisoners of war was at the very low rate of 39 per thousand or about 15 percent lower than during July. The experience among prisoners of war continues very much more favorable than for U.S. troops, for whom current morbidity from these causes is at a rate of about 65 per thousand. Just as in July, morbidity from these causes was highest for Italian Service Units (78 per thousand), followed next by German prisoners (35 per thousand), with Italian prisoners having the lowest morbidity (15 per thousand).

During August the morbidity from malaria, representing predominantly cases presumably acquired outside the United States, was at a rate of 40 per thousand, as contrasted with 62 per thousand in July. Morbidity from this cause has been declining continuously each month since April, when the record high rate of 94 per thousand was reached. The number of cases of malaria reported as being presumably acquired in this country was 11, which is materially lower than during the previous two months.

The admission rate for diarrhea and dysentery increased sharply to 14 per thousand, which is somewhat in excess of the July experience for U.S. troops in this country, but is, nevertheless, relatively low considering the seasonal cycle of morbidity from this cause. During August there were also reported one new case of diphtheria, one new case of Rocky Mountain spotted fever, and four new cases of paratyphoid fever. New cases of other communicable diseases considered in the following tables were relatively few.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 AUGUST 1944

PRISONERS OF WAR (CONT'D)

The camps reporting the highest morbidity from disease were: Camp Somerset, Md. (G), Camp Gordon Johnston, Fla. (G), Fort Bliss, Tex. (G), Camp Chaffee, Ark. (G), and Fort Lewis, Wash. (G), all of which had rates of more than 1500 per thousand. Most of these camps also had relatively high morbidity during July.

High morbidity from injury was reported by the following camps: Clinton, Miss. (G), Camp Davis, N.C. (G), Camp Gordon Johnston, Fla. (G), Camp Shelby, Miss. (G), Ashford, W. Va. (G), and Fort Bliss, Tex. (G), all of which had rates in excess of 500 per thousand. Clinton, Miss. has had an admission rate from injury in excess of 300 per thousand during every month of this year.

The number of prisoners of war remaining under treatment in hospital at prisoner of war camps as of 25 August 1944 and the corresponding rates per thousand strength are shown below. The total number of such prisoner patients at the end of August was about 50 percent higher than at the end of July, partly because of the increased number of prisoners of war but chiefly due to the establishment of two special hospitals for prisoners of war (Glennan G.H. and McAlester, Okla.) which had not previously submitted reports for prisoner of war patients. Out of 5013 prisoner patients, 1133 were at Glennan G.H. and 801 at McAlester.

In addition to the prisoners of war remaining under treatment at the prisoner of war camps or special hospitals for prisoners of war, there were 1124 remaining under treatment in other hospitals; of these 985 were in General Hospitals (chiefly at Bushnell G.H., Fitzsimons G.H., Halloran G.H., and Mason G.H.).
